

ADS - Backup

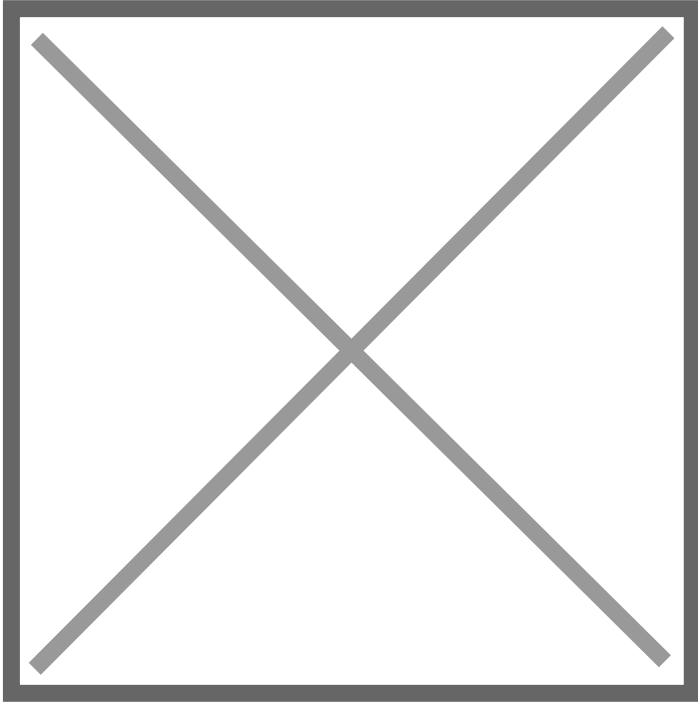

Creating a backup for any device in the network is important.

ADS has its own automatic process to create scheduled backups and upload it to a remote server.

The most important part is having an SFTP server running and accessible from the ADS IP address. To implement the automatic backup of ADS expand **Configuration** menu then select **Backup Configuration**

In the next screen select **Schedule Backup**

Enter the information that fill out your needs.

In the backup method select SFTP and enter the information already set up in your server.

Backup history provides information for the last backup created.
