

WebLM - Patch Install

Before you begin

Create backup of WebLM.

Copy the patch file, feature pack file, or the service pack file to the WebLM server.

Verify the installed WebLM version.

Procedure

Log in to the WebLM command line interface with administrator privilege CLI user credentials.

Verify the MD5 checksum of the patch file that you want to install.

Type `WebLMPatchdeploy <absolute path to the WebLM feature pack file>`.

For example, `WebLMPatchdeploy /home/avaya/VEWebLM_8.0.x.0_xxx.bin`.

The system installs the patch file.

To accept the license terms, read the End User License Agreement carefully, and type Y.

The patch installation takes about 10–15 minutes to complete. You can view to monitor the WebLM patch progress status from the `/var/log/Avaya/WebLM_Patch.log` file.

If the installation is successful, the system displays a warning message on the dashboard and on the command line interface to restart WebLM if kernel is updated.

After patch installation is successful, relogin to CLI to check if the updated kernel is running.

Restart the standalone WebLM.

Next Steps

If the patch or service pack installation fails, perform a snapshot restore to go to the previous version of WebLM.
